Reflection

In this exercise, I learned the difference between Stack, Queue, Priority Queue, and Linked List, as well as when each one should be used. I had some difficulty with Part C because I needed to think about the correct way to find the insertion position based on priority, while still keeping the arrival order when two items have the same priority. For Part D, the hardest part for me was implementing the Linked List using connected nodes instead of an array. I first had to understand how traversal works using the next property before I was able to properly arrange the insert() and removeAt() methods. Overall, this activity helped me understand more about how data structures work in real-life situations, such as managing support tickets. I also liked that I was able to apply the concepts of LIFO and FIFO in actual code, and I learned that I need to be more careful when tracing the logic before implementing each method.
